

Ski Jumping Return-to-Sport Strategy

Developed with Ski Jumping Canada and Nordic Combined Ski Canada

Stage	Aim	Activity	Goal of each step
1	Symptom-limiting activity and intro movement	Daily activities that do not provoke symptoms. -walking, stationary bike, low intensity	Movement, blood flow Gradual re-introduction of work/school activities
2	Light aerobic activity	-longer duration stationary bike, stationary bike and walking/treadmill walking *no jogging, no outdoor skiing -mild resistance training -core, walking lunges, static squats, and balance training for ski jumping	Increase heart rate Building intensity but remain sub-symptom threshold.
3	Sport-specific exercise	-increase time + intensity stationary bike -introduce outdoor cardio: (i.e., Nordic or snowshoesing), jogging (=environmental component); **Time/intensity parameters < parameters accomplished on stationary bike -moderate resistance training -sport-specific position, walk throughs or position change/preparation for jumps -introduce light/moderate “dryland” plyos for jump prep and landing prep (box jumps)	Add movement
4	Sport-specific practice	incorporate interval training in cardio routine -return to full time/intensity training session -return to regular resistance training drills/routine -trial downhill runs (increasing difficulty hill size, start small), no ski jumping on hill -Box jumping and lunge jumps -add trampoline work (if available) -build to normal pace of drills in 'dryland' training	Exercise, coordination and increased thinking
5	Full intensity practice	- Medical consult before re-intro of full practice jumps (given height and landing component of ski Jump) -return to normal downhill ski pace/mechanics -reintroduce basic -->intermediate jumps on downhill runs	Restore confidence and assess functional skills by coaching staff
6	Medical Clearance	Return to full jump height Downhill/jump competitions
